- ❑ Mobile phones usage, especially through Smart phones, is blooming.
- ❑ New ways to interact with information on the Web are appearing.
- ❑ Constraints imposed by limitations of such devices pose challenges to Web developers and designers.
- ❑ Mixing these factors with accessibility issues becomes more difficult.

- ❑ Ensuring that a Web site is tailored to mobile devices and to people with disabilities.
  
- ❑ WCAG – ensuring that no barriers to access exist.
- ❑ MWBP – ensuring that no mobile constraints exist.
  
- ❑ WCAG/MWBP overlap technically in some evaluation methods (for different purposes).
  
- ❑ MWBP require HTTP content negotiation and inspection to ensure the evaluation of mobile Web site (not desktop/full)
- ❑ WCAG applied to mobile version of Web site.
